

# ALPHA TOUCH SMART LIVING

## What is ANPR?

ANPR or Automatic Number Plate Recognition is used to capture and recognise vehicle number plates. For businesses this is a useful tool when coupled with a barrier system only authorised vehicles are given access. With these two components linked granted security access is automatic.

## Intelligent traffic management

ANPR is great but the cameras need to know what vehicle number plates are allowed through the barrier. For some businesses the authorised vehicles may change infrequently but for others a constant update is required where granted access times are short. The Alpha Touch ANPR system provides has a local management tool for adding and deleting vehicles registration numbers for one or more cameras simultaneously.

## Integration with third party booking system systems

As well as local configuration of the ANPR cameras the ATSL ANPR system integrates with third party booking systems.

## Intelligent traffic management

The ATSL ANPR system has a built-in Traffic Management System with direction priority. This is important when vehicles are leaving a main road to come onto the ANPR protected site as they are given priority to enter first thereby clearing the main road as quickly as possible.

## Key Features

1. Integration with third party booking systems
2. Integration with third party barrier systems
3. Automatic granted access between dates
4. Built-in Traffic Management with direction priority
5. Local access to User Interface with Web browser for manual entry of vehicle plates
